

ASAD JAVED

TELEPHONY ENGINEER

Lahore, Pakistan 54000 | +92 323 5546763 | asadjvd20@hotmail.com | LinkedIn: Asad Javed

Innovative and Versatile Telephony Engineer with deep knowledge and hands-on experience of cloud-native solutions, container orchestration (Kubernetes, Docker), and Site Reliability Engineering (SRE). Seasoned at creating scalable scripts and technology infrastructure, designing and deploying Grafana dashboards, and building and maintaining DevOps pipelines for seamless automation and deployment. Strong background in incident response, disaster recovery, and real-time monitoring. Expertise in networking fundamentals, SIP/TCP troubleshooting, and Linux system administration, ensuring secure, optimized, and fault-tolerant deployments. Instrumental in formulating custom Bash and Python scripts to streamline large-scale testing, integrated with Jenkins pipelines for one-click execution.

AREAS OF EXPERTISE

Automated Testing & Code Quality	Project Lifecycle Management	Site Reliability Engineering (SRE)
Prometheus & Grafana Monitoring	System & Database Performance	Cross-team Collaboration
Disaster Recovery System Deployment	API Load and Performance Testing	CI and CD Pipeline Development

TECHNICAL PROFICIENCIES

Automation & Scripting: Bash, Python, Jenkins | **Containerization & Orchestration:** Docker, Kubernetes (CKA)

Monitoring & Performance Testing: Prometheus, Grafana, JMeter | **Networking:** Wireshark, SIP/TCP

Infrastructure & Linux: Linux Administrator, Networking Fundamentals | **Database Monitoring**

EDUCATION & CERTIFICATION

B.Sc. (Hons) in Computer Science

Asia Pacific University, Kuala Lumpur, Malaysia

Awarded in collaboration with University of Staffordshire – 2019

Certified Kubernetes Administrator (CKA) Certification

The Linux Foundation – 2025

AWS Certified Cloud Practitioner

Amazon Web Services (AWS) - 2025

CAREER SUMMARY

Afiniti – Lahore, Pakistan

Feb 2021 – Feb 2025

Telephony Engineer II

- Designed and maintained robust telephony environments, while optimizing and accelerating the deployment of latest sprints on Dev and traffic labs by resolving telephony issues for the development teams.
- Strengthened system resilience by implementing JMeter for API load testing, configuring Prometheus for continuous monitoring, and creating Grafana dashboards for real-time tracking of database performance.
- Developed a comprehensive test automation framework that streamlined manual testing, automated large-scale call dialing and login procedures, and integrated seamlessly with Jenkins for rapid execution.
- Managed the maintenance of lab infrastructures integrated with telephony services, while building and maintaining the network infrastructure in coordination with infrastructure and network teams.
- Elevated infrastructure reliability by developing scripts for continuous machine statistics tracking and real-time alerts.

- Augmented the reliability of Afiniti feature services by diagnosing, troubleshooting, and resolving SIP transaction and SHM queue issues in Docker containers, improving telephony product capacity.
- Automated load testing by executing a Bash script and CI/CD pipeline in Jenkins, while enabling one-click execution.

Afiniti – Lahore, Pakistan

Nov 2019 – Jan 2021

Analyst Telephony Engineer

- Executed the installation and configuration of SIP call simulators, TARTS (Avaya) and SIPp, enabling comprehensive testing of Afiniti's telephony products with Avaya Media Servers.
- Minimized testing time and increased consistency by automating regression testing tasks with custom Bash scripts.

KEY PROJECTS

Project 1: Automated Load Testing Using Bash & Jenkins | Technologies: Bash, Expect, Linux, Jenkins

- Created a single Bash script to automate load testing, eliminating manual intervention that improved test efficiency.
- Reduced operational delays by executing fully automated login, load generation, and service startup mechanisms.
- Optimized testing workflow by integrating a one-click execution pipeline into Jenkins, curtailing test execution time.

Project 2: API Performance Testing with JMeter | Technologies: JMeter, Prometheus, Grafana

- Integrated JMeter-based API routine tests into CI/CD pipelines for continuous monitoring and early issue detection.
- Automated performance tracking by integrating JMeter with Prometheus for real-time data collection and analysis.
- Devised real-time Grafana dashboards, enabling proactive tracking of API performance metrics and system's health.

Project 3: Cold Disaster Recovery Automation | Technologies: Ansible, Layer 3 Networking, Microservices

- Automated MCS configuration failover in a Layer 3 cold DR setup by developing a routing entity replication script.
- Designed a dynamic port blocking mechanism to control traffic flow and ensure failover safety for microservices.
- Updated Ansible inventory and role files for cold DR deployment, ensuring proper configuration and validation before DevOps handoff, resulting in reduced deployment errors and downtime.
- Improved system reliability by mastering Ansible automation, resolving issues, and configuring failover infrastructure.

Project 4: Chaos Testing in a Dockerized Microservices Environment | Technologies: Linux, Docker CLI, Grafana

- Executed chaos testing in a Linux environment using Docker CLI to simulate real-world microservice failures.
- Created a structured testing approach using tc qdisc to replicate latency issues and optimize microservice efficiency.
- Improved operational efficiency using Prometheus-powered Grafana dashboards to detect performance bottlenecks.
- Formulated a robust observability framework, improving microservice fault tolerance and response to failures.
